Assignments Submission Rules

- All assignments **MUST be submitted to BlackBoard site**, any other forms of submission are NOT accepted.
- If the submission is delayed **for one day, 20% discount** on the total score. If it is **delayed for more than a week, any submission is NOT ACCEPTABLE!** This assignment is 0 point.
- In the case of plagiarism: at the 1st time, the assignment was 0 for all concerned students and at the 2nd time, the grade of the experimental course is 0 for all concerned students.
- Reminder:
 - Assignment scoring and the score publication would be completed within two weeks after the publication of assignment. **If you have any question about the score, please email the relevant reviewer in one week after the score publication.**

Experimental tool kits

- Learn and practice **MIPS** (QtSpim / Mars)
- Design and implement an **CPU**
(vivado + FPGA based Development Board)

- QtSpim
 - **QtSpim is the newest version of Spim that currently being actively maintained, runs on Microsoft Windows, Mac OS X, and Linux.**
 - Spim, A self-contained simulator that runs MIPS32 program developed by Prof. James Larus from University of Wisconsin-Madison
 - **QtSpim reads and executes programs written in assembly language (汇编语言) for a MIPS computer. QtSpim does not execute binary (compiled) programs.** To simplify programming, QtSpim provides a simple debugger and small set of operating system services
 - **QtSpim implements MOST of the MIPS32 assembler-extended instruction set.** (It omits the floating point comparisons and rounding modes and the memory system page tables.) which means that QtSpim will **NOT run programs for ALL MIPS processors.**

Load file and Do the simulation

Step1: loading a file (assembly code file usually have the extension “.s”)

- Open file : **File->Load File** or **File ->Reinitialize and Load File**
- Tips:
 - **Reinitialize and Load File** : **Clears** all the changes made by a program, deleting all of its instructions, then **reload** the last file
 - **Before doing the simulation, make sure clear registers**, you can do it by :

Simulator->Clear Registers or by related tools.

Step2:

- **Run file** : **Simulator->Run / Continue**
- The value of register in left window will be refreshed, the program's output will appear in the Console window.

MARS is a **lightweight** interactive development environment (IDE) for programming in **MIPS** assembly language, intended for educational-level use with Patterson and Hennessy's Computer Organization and Design.

MARS requires Java J2SE 1.5 (or later) SDK installed on your computer.

Assembly Language(汇编语言) Overview

- Assembly language
 - The main body of assembly language (汇编语言) is assembly instruction (汇编指令) .
 - Assembly instructions(汇编指令) and Machine instructions(机器指令) differ in instruction expression. **Assembly instruction is a human-friendly writing format of machine instruction.** Assembly language is the mnemonic of machine language. For example
 - machine instruction “1000100111011000” means that send the contents of register BX to AX.
 - The assembly instructions are written as “mov ax, bx”. Such writing is similar to human language and easy to read and remember.
 - Feature: programs written in assembly language are inherently machine-specific and must be totally rewritten to run on another computer architecture
- CISC (intel x86) vs **RISC** (ARM, **MIPS**, RISC-V)

Assembly Program Structure

data declarations + program code

- **part1: Data Declarations**
 - placed in section of program identified with assembler directive(汇编说明/汇编器指示符): **.data**
 - **declare** variable names used in program; storage allocated in main **memory** (RAM)
- **part2: Program Code**
 - placed in section of text identified with assembler directive: **.text**
 - contains program code (instructions)
 - starting point of code e.g. execution given label **main**:
 - ending point of code should use exit system call (see below in “System Calls” part)
- **part3: Comments (suggested)**
 - anything following # on a line
This stuff would be considered as comment

```
# Comment giving name of program and description of function
# Template.s
# Bare-bones outline of MIPS assembly language program

        .data        # variable declarations follow this line
                # ...

        .text        # instructions follow this line

main:                # indicates start of code (first instruction to execute)
                # ...

# End of program, leave a blank line afterwards to make SPIM happy
```

System Calls

- **System Calls**
 - **SPIM** provides a small set of **operating-system-like services** through the system call (**syscall**) instruction.
 - To request a service, a program **loads the system call code into register \$v0** and **arguments into registers \$a0~\$a3** (or \$f12 for floating-point values).
 - **System calls that return values put their results in register \$v0** (or \$f0 for floating-point results).

Service	System call code	Arguments	Result
print_int	1	\$a0 = integer	
print_float	2	\$f12 = float	
print_double	3	\$f12 = double	
print_string	4	\$a0 = string	
read_int	5		integer (in \$v0)
read_float	6		float (in \$f0)
read_double	7		double (in \$f0)
read_string	8	\$a0 = buffer, \$a1 = length	
sbrk	9	\$a0 = amount	address (in \$v0)
exit	10		
print_char	11	\$a0 = char	
read_char	12		char (in \$v0)
open	13	\$a0 = filename (string), \$a1 = flags, \$a2 = mode	file descriptor (in \$v0)
read	14	\$a0 = file descriptor, \$a1 = buffer, \$a2 = length	num chars read (in \$v0)
write	15	\$a0 = file descriptor, \$a1 = buffer, \$a2 = length	num chars written (in \$v0)
close	16	\$a0 = file descriptor	
exit2	17	\$a0 = result	

A demo

The QtSpim MIPS simulator interface is shown. The 'Registers' window on the left lists 32 registers. The 'Text' window in the center displays assembly code for the 'User Text Segment' and 'Kernel Text Segment'. The 'Console' window at the bottom right shows the output 'hello Internet'. The status bar at the bottom indicates 'Memory and registers cleared'.

Registers:

- PC = 400038
- EPC = 0
- Cause = 0
- BadVAddr = 0
- Status = 3000fff10

[800001b0] srl $4, $26, 2
```

Console:

```
hello Internet
```

Status: Memory and registers cleared

```
# text segment
.text
.globl main

main:
    la $a0, str          # execution starts here
    li $v0, 4            # put string address into a0
    syscall              # system call to print a string
    li $v0, 10
    syscall              # system call to exit

#data segment
.data

str: .asciiz "hello Internet\n"
```

Update the demo by deleting the line “.globl main”, rerun it on the Qtspim, what will happen?

Run the updated demo on the Mars, what will happen?

Practice & thinking

- 1. Install QtSpim/Mars on your PC and refer to the 'help' page to find:
 - Is the function of '**syscall**' in Qtspim the same with Mars?
 - What's the name and ID of the **registers** used while invoke the "**print integer**" **syscall**?
- 2. **Make an assembly file, load and run** it by QtSpim/Mars:
 - The assembly code should **get** your ID and name, and **print** them out
 - Is there any **object file** or **executable file** generated while doing the simulation?
 - **Where** is your ID and name **stored** while the assembly code get them? **register** or **memory**?
 - What's the **Machine code** of the MIPS instruction "**li \$v0,10**"
- 3. Find an assembler for MIPS from the Internet, use it to assemble the code of question 2 to generate an executable file, Can the executable file run on your computer and explain the reason.
